SKILLS

Frontend

Vue 3 / Vue 2 (TypeScript · Vite · Pinia · Vue Router · vue-i18n) · Vuetify · Quasar · Astro · Chart.js · Vitest · Testing Library · Cypress

Backend

Python (FastAPI · Flask · GraphQL/ Ariadne · SQLAlchemy · asyncio · Pydantic) · Go (Gin) · Node.js / Express · MySQL · Redis / Valkey

Cloud & DevOps

AWS (Lambda · ECS/Fargate · SQS · SNS · S3 · RDS · ElastiCache · DynamoDB · API Gateway) · Terraform · AWS SAM · Docker · Bitbucket Pipelines · Snyk · Trivy · Bandit · gitleaks

Data & AI

BigQuery · dbt · pandas · PyTorch · Pinecone · OpenAI embeddings · RAG pipelines

Other

C · ARM Assembly · MATLAB · LTspice · LaTeX

LANGUAGES

English

Native

Japanese

Upper Intermediate – Advanced

SUMMARY

Full-stack engineer at a Japanese multilingual AI-chat company, shipping in Python, TypeScript, Go and Terraform across a ~20-service AWS fleet. Contributed heavily to the authorization layer, CI security pipeline and build tooling, while delivering customer-facing AI, analytics, payments and hotel-PMS integration features end to end.

EXPERIENCE

Software Engineer · Kotozna Inc.

08/2024 – Present · Tokyo, Japan

Tech stack: Python, TypeScript (Vue 3), Go, Terraform, MySQL, AWS

- Built a customer-facing analytics dashboard end to end across three repositories — guest event instrumentation (11 event types), dbt models, a BI service layer wrapping ~30 endpoints, a Vue 3 / Chart.js dashboard module, CSV/PDF export, and bilingual (EN/JA) user documentation.
- Designed a fail-closed authorization framework for a multi-tenant GraphQL API — organization and per-resource role gating with import-time misuse detection — and remediated cross-organization IDOR vulnerabilities.
- Built a real-time weather and disaster-information integration for production AI chatbots against the Japan Meteorological Agency's undocumented JSON feed — an async client with caching and fuzzy place-name resolution, backed by thorough test coverage.
- Shipped hybrid (vector + keyword) RAG configuration per bot with index re-sync across five mutation paths, and migrated submenu vector search from FAISS/Redis to Pinecone with batched async embeddings.
- Delivered Japanese-tax-compliant electronic receipt issuance end to end across five repositories — claim snapshotting against a mutating hotel-PMS API, a ReportLab PDF Lambda with embedded CJK fonts, and bilingual SES email delivery.
- Root-caused a Stripe billing desync spanning three compounding defects (webhooks returning HTTP 200 on failure, dead code, a gevent/asyncio event-loop collision) and built self-healing subscription recovery with explicit double-billing safeguards.
- Led a fleet-wide credential-eradication programme across ~20 repositories and standardized an 8-check CI security pipeline (Snyk, Trivy, Bandit, gitleaks, ruff, deptry) — remediating findings rather than suppressing them.
- Migrated ten Python services to uv + Python 3.13 with uniform task interfaces, multi-stage Docker builds and shared CI anchors; executed a live cross-account AWS migration of the translation platform in Terraform.
- Diagnosed and fixed an LLM answer-quality regression by restructuring retrieved context from assistant-role messages into a consolidated system knowledge-base block placed after conversation history — eliminating "no data available" failures on repeated questions.

(JLPT N2); fluent in daily and professional communication

PROJECTS

Bachelor's Thesis: Data-Efficient Cross-Corpus Speech Emotion Recognition

08/2023 – 04/2024

- Trained and evaluated deep-learning models on emotional speech datasets (TESS, SAVEE, RAVDESS, IEMOCAP) for cross-corpus emotion recognition.
- Applied generative and discriminative domain adaptation and generalization algorithms.
- Built neural networks using PyTorch, NumPy, Pandas, Librosa, Matplotlib and Seaborn.

Software-Defined Radio and Analog Filter Design

08/2023 – 11/2023

- Employed PlutoSDR, RTL-SDR, Analog Discovery 2, LTspice and GNU Radio to generate, transmit and analyze signals under interference.
- Designed higher-order op-amp filters to suppress noise and achieve target packet success rates.
- Transmitted and received two message signals with BFSK modulation using TDMA.

EDUCATION

B.Eng. Electrical Engineering, Minor in Japanese Language

National University of Singapore (NUS)

08/2020 – 07/2024

- GPA: 4.61 / 5.00
- Relevant coursework: Machine Learning, Image Processing and Analysis, Signal Analytics, Digital Design, Microcontroller Programming and Interfacing

Short-term Student Exchange Program (OUSSEP)

Osaka University

04/2023 – 08/2023

- Coursework: Health Service and Medical Care in Japan; Japan: Society and Ideology; Intro to Japanese Law; Osaka in Modern Japanese Literature
- Volunteered in Project HELP, mentoring students for the IELTS exam.
